**Overprivileged
authorization policies
are like open doors,
presenting a significant
risk to an organization.**

Enter Generative and Agentic AI

- Complicates identification of whether access originates from human users or AI agents.
- Increases the risk of disclosure of sensitive data through large language models (LLMs).
- Creates unpredictable behaviors, given AI agents' nondeterministic nature.
- Drives the proliferation of agents, which expands workloads and increases the number of points requiring access decisions.

Authorization Management Platform (AMP)

A platform that provides capabilities to manage authorization across a diverse set of systems and applications.

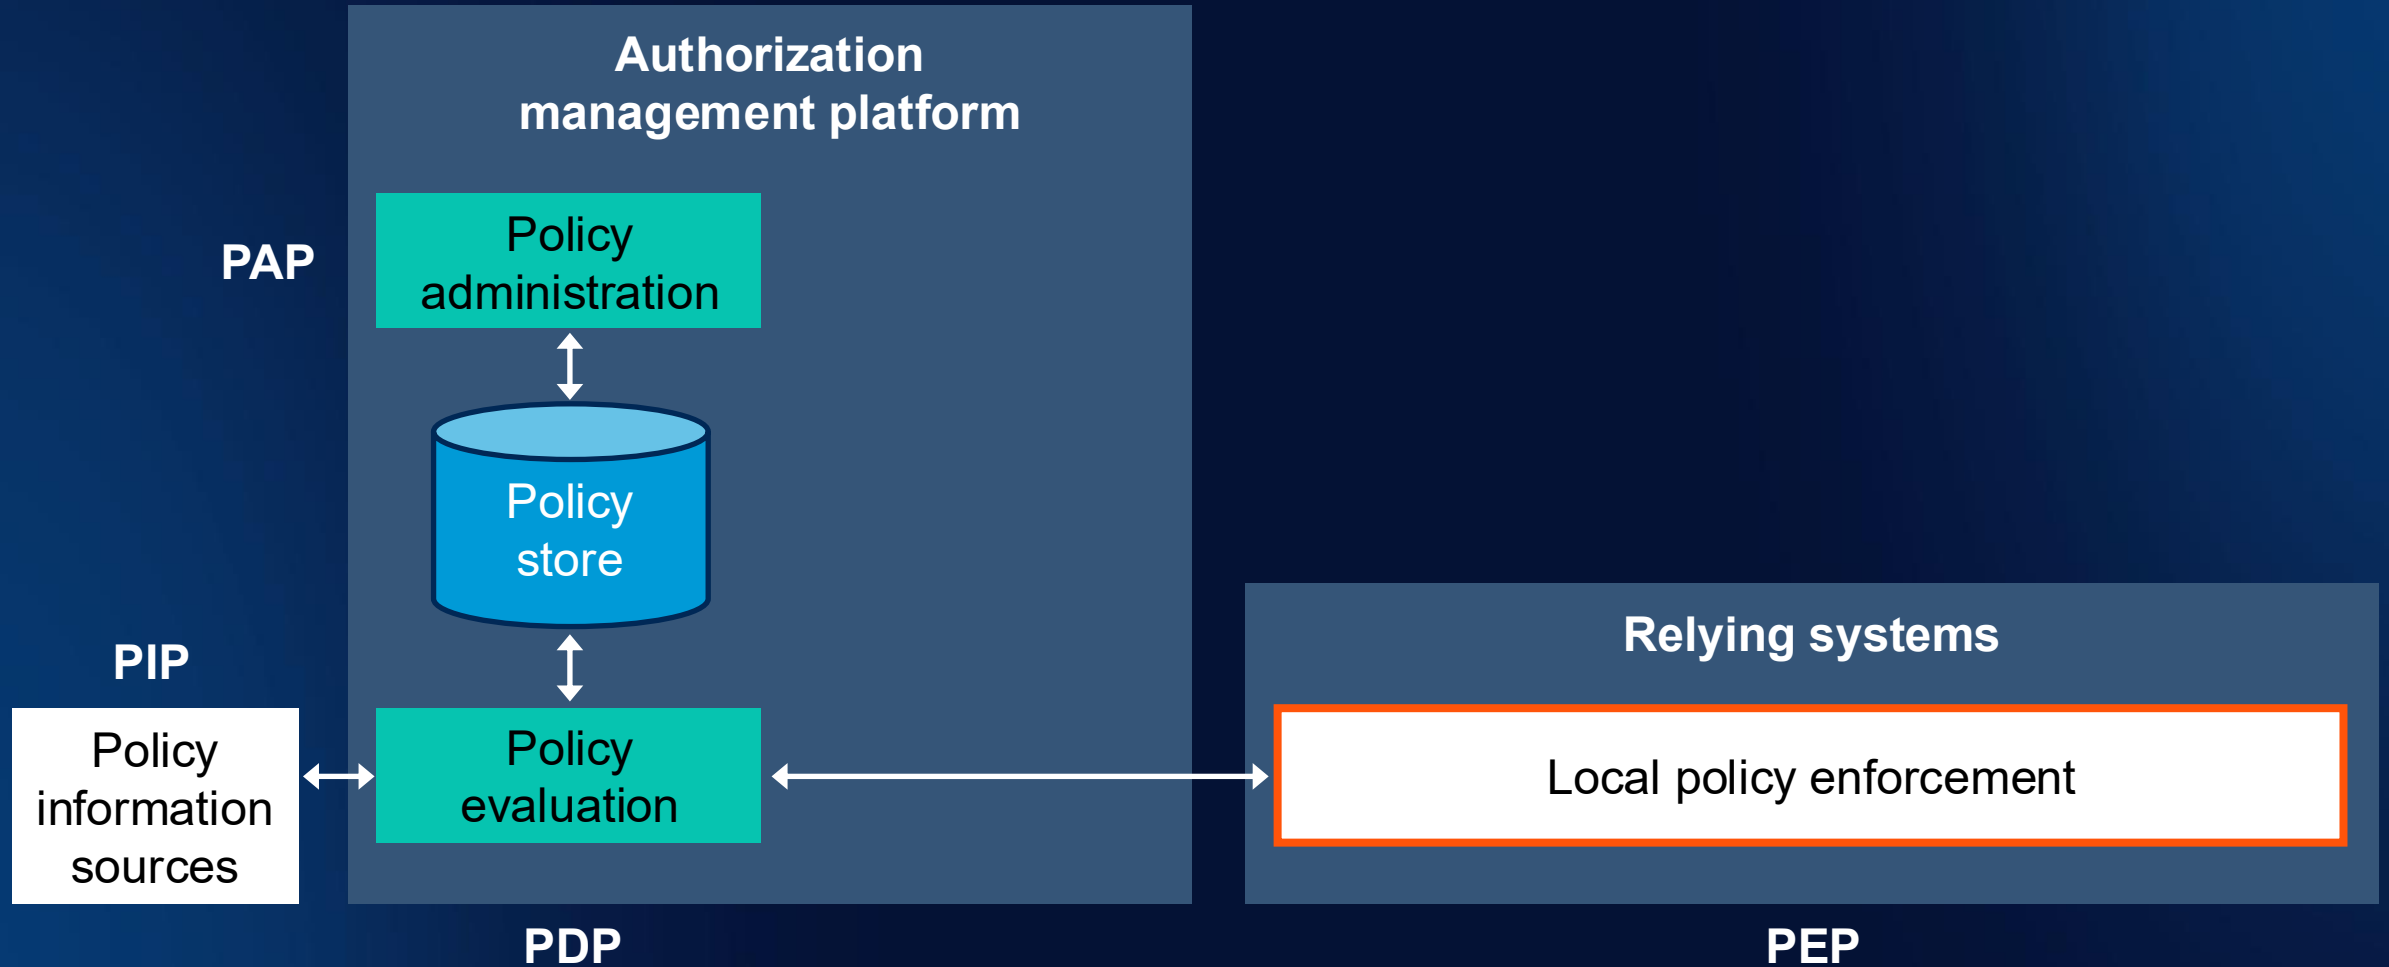

AMP Overview

Core Components

AMP Overview

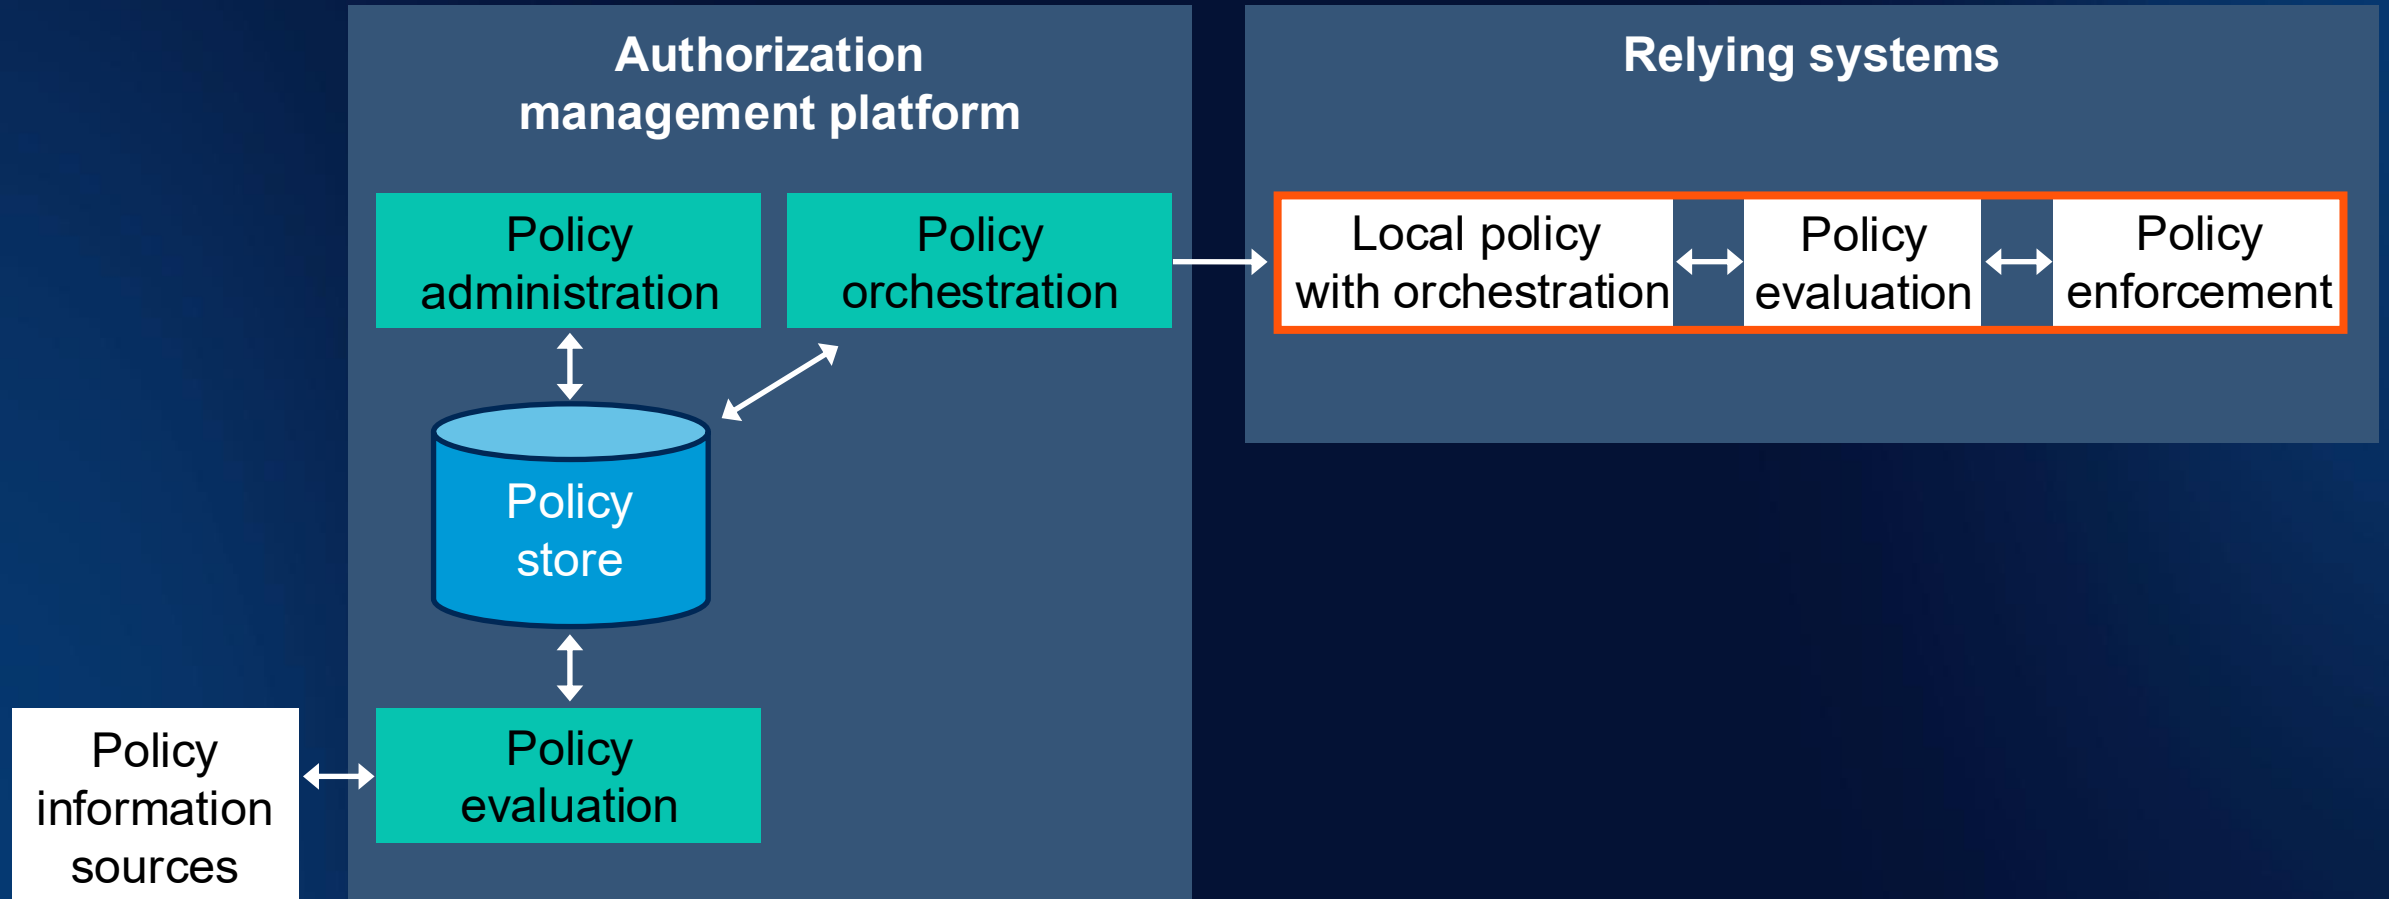

Externalized Authorization Management (EAM)

AMP Overview

Token-Facilitated Authorization — (Option 1)

AMP Overview

Token-Facilitated Authorization — (Option 2)

Benefits of AMPs

- 1 Improves all policy management by centralizing and aligning policy administration.
- 2 Enhances security by reducing policy blind spots.
- 3 Improves compliance and reduces risk by applying consistent, least-privileged policies.

AMPs can cover a larger number of applications and systems by including policy orchestration, increasing security and reducing the risk of unauthorized access.

AMP Deployment Considerations

Identify AMP integration candidates

Adopt interoperability standards

Assess policy information sources

Understand complementary approaches

Identify AMP Integration Candidates

Ideal candidates for **policy orchestration** include:

Data management and data lakes

Reporting and business intelligence tools (e.g., Microsoft Power BI)

API gateways

Open policy agent (OPA) supported systems

Identify AMP Integration Candidates

Ideal candidates for **externalizing authorization** include:

Applications with complex, dynamic or frequently changing access control policies

Commercial applications that expose their authorization logic

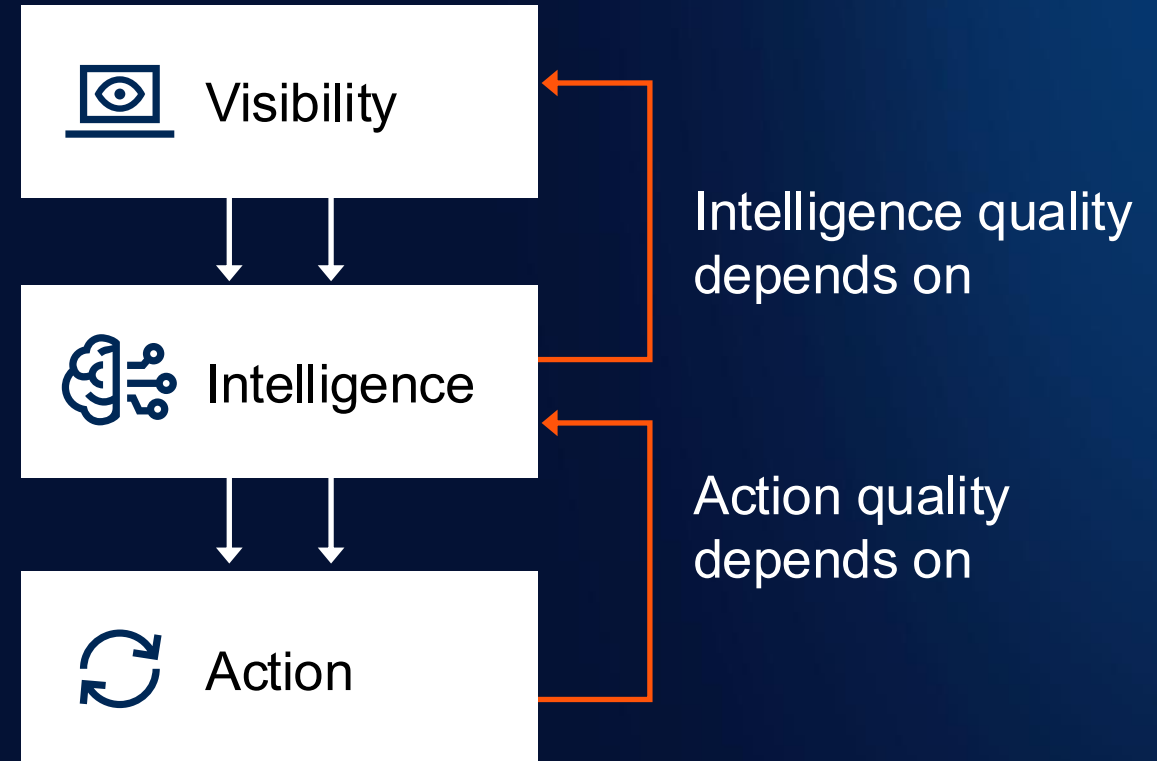

Regulated applications that require detailed audit trails, separation of duties and policy transparency for compliance purposes

Ideal candidates for **token-facilitated authorization** include:

Applications that support token consumption for authorization decisions (e.g., OAuth2, SAML)

Assess Policy Information Sources

- Identify the necessary source data needed for your policies (policy information).
- Assess the quality and availability of the source data.
- Account for the effort to integrate data that resides in multiple data stores.

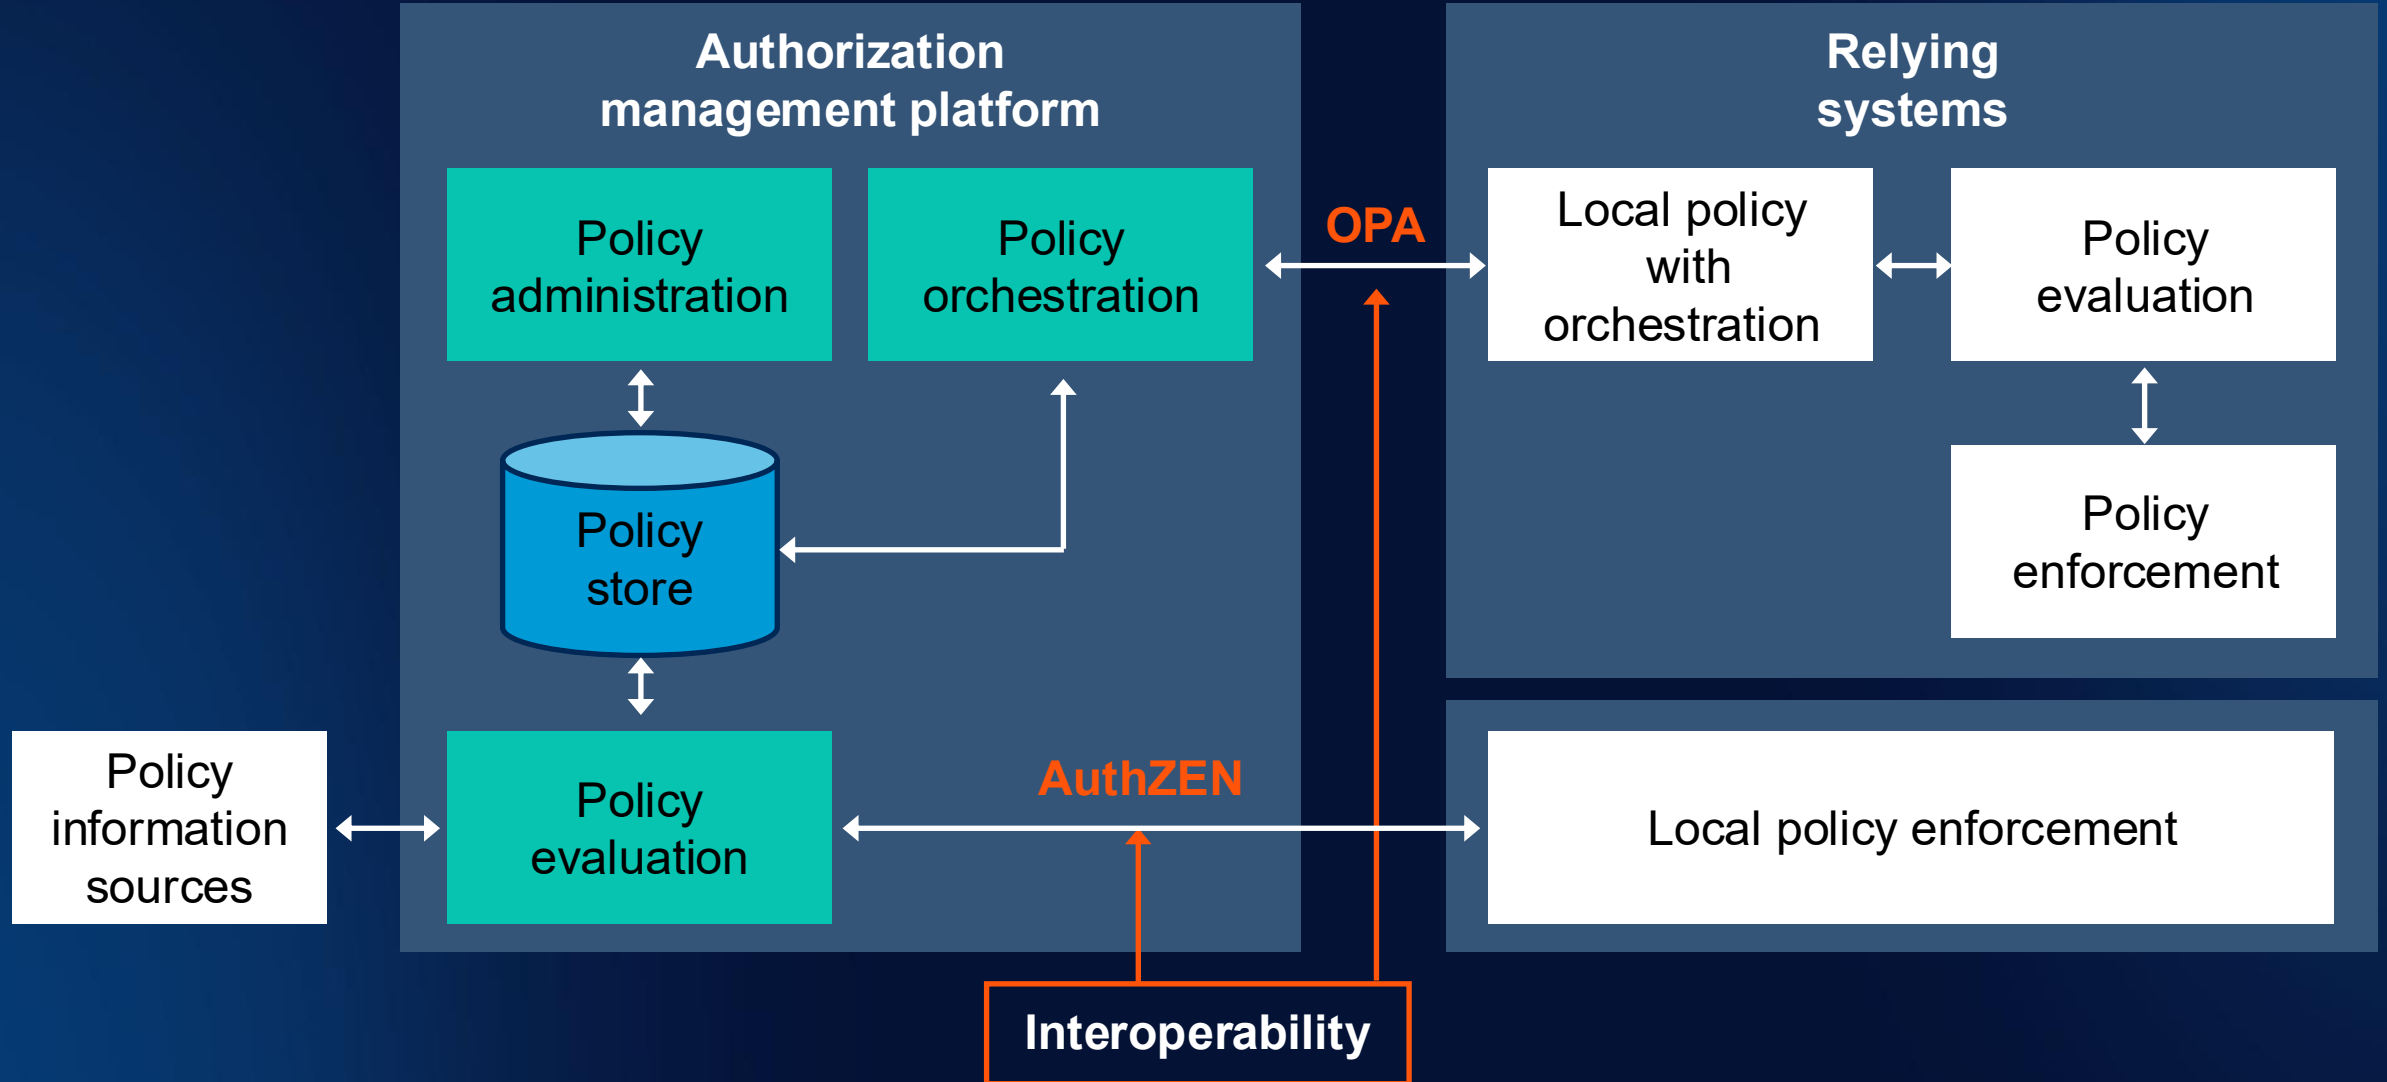

Availability and quality of information directly impacts your authorization policies!

Adopt Interoperable Authorization Standards

Evaluate interoperable standards that support the ability to integrate policy management across vendor solutions (e.g., AuthZEN, OPA).

Prefer vendors that have **demonstrated their capabilities** in interoperability sessions and have customers with implementations.

AuthZEN and OPA Authorization Standards

Source: [AuthZEN Working Group — Overview](#), OpenID Foundation

Understand Complementary Approaches

- IGA tools for entitlement management:
 - Manages access based on static roles, groups or memberships
 - Lacks dynamic and real-time authorization controls
- Access management for coarser-grained authorization:
 - Relies on static roles, groups or memberships
 - Lacks fine-grained authorization

Understand the Risks of a DIY Solution

Costs of development and maintenance

Coding bugs that could be exploited

Maintaining regulatory adherence

No community and vendor support

Longer time to market

Ensure a successful AMP rollout by identifying high-impact integration candidates and adopting interoperable authorization standards.

SGNL	✓				✓
SecureAuth					✓
Thales	✓				

**Define your key requirements,
as vendors don't all address
the same use cases.**

Recommendations

- ✓ **Enable** greater business agility and security by expanding the scope to include commercial applications, infrastructure and data platforms as part of your authorization strategy.
- ✓ **Prioritize** your AMP use cases — implement the highest priority, most feasible use cases first. Take an incremental approach.
- ✓ **Reduce** vendor lock-in and facilitate interoperability between authorization components by adopting standards, such as AuthZEN.
- ✓ **Prioritize** robust policy life cycle management and data integration capabilities that provide essential policy information to develop more accurate authorization policies.
